Reducing Tobacco Use in Minnesota: Research Into Action

I have no financial relationships to disclose

Funding for my research described in this presentation was provided by
The Robert Wood Johnson Foundation, The Centers for Disease Control and Prevention, the National Cancer Institute, and the American Cancer Society
Tobacco industry clearly understands the impact of tobacco taxation

"With regard to taxation, it is clear that in the US, and in most countries in which we operate, tax is becoming a major threat to our existence."

"Of all the concerns, there is one - taxation - that alarms us the most. While marketing restrictions and public and passive smoking (restrictions) do depress volume, in our experience taxation depresses it much more severely. Our concern for taxation is, therefore, central to our thinking...."
Tobacco Taxation in the U.S.

• Federal cigarette tax initially adopted in 1864
  – Raised during war time/lowered during peace time
  – Set at 8 cents per pack in 1951
  – Doubled to 16 cents per pack in 1983
  – Currently 39 cents per pack
    • About 60% of inflation adjusted value of 1951 tax

• State cigarette taxes
  – First adopted by IA in 1921; NC last to adopt in 1969
  – Currently: 7.0 cents/pack (SC) to $2.46/pack (RI)
  – Average 91.7 cents per pack (25.7 cents in tobacco growing states; 100.5 cents in other states)
  – Most tax other tobacco products
  – Sales tax applied to tobacco products in most states

Local Taxes

• Many localities add additional, typically low, tax
  – $1.50 in New York City
  – $2.68 in Chicago/Cook county
STATE CIGARETTE EXCISE TAX RATES
AS OF JANUARY 27, 2006

NOTES:
Red text indicates a state where most recent tax increase became effective during the current calendar year.
The Federal excise tax rate is currently at $0.39 per pack.
-New York City imposes an additional excise tax of $1.50 per pack.

Tobacco Taxation in Minnesota

• Cigarette excise tax initially adopted in 1947
  – 4 cents per pack

• Raised infrequently over time
  – Most recent “tax” increase was from 43 cents to 48 cents per pack on July 1, 1992
  – 75 cent “fee” added 8/1/05
  – Currently 14th among state cigarette taxes
  – Additional 35 cents per pack “equity fee” for non-participating manufacturers

• Tax on other tobacco products: 35% of manufacturers’ price
  • Higher than the almost 20% share of state cigarette taxes in wholesale cigarette price
Inflation Adjusted Cigarette Prices, Minnesota 1955-2006

FY2006 average price estimated
FY2006 average price estimated
Tobacco Taxes and Tobacco Use

• Higher taxes induce quitting, prevent relapse, reduce consumption and prevent starting.

• Estimates from high-income countries indicate that 10% rise in price reduces overall cigarette consumption by about 4%
  • price elasticity of demand: percentage reduction in consumption resulting from one percent increase in price

$N = 51$
Tobacco Taxes and Tobacco Use

- Higher taxes induce quitting, prevent relapse, reduce consumption and prevent starting.

- Estimates from high-income countries indicate that 10% rise in price reduces overall cigarette consumption by about 4%
  - price elasticity of demand: percentage reduction in consumption resulting from one percent increase in price

- About half of impact of price increases is on smoking prevalence; remainder is on average cigarette consumption among smokers

- Some evidence of substitution among tobacco products in response to relative price changes

Source: Chaloupka et al., 2000
Cigarette Prices and Smoking Cessation

- Growing evidence that higher cigarette prices induce smoking cessation
  - 10% price increase reduces duration of smoking by about 10%
  - 10% price increase raises probability of cessation attempt by 10-12%
  - 10% price increase raises probability of successful cessation by 1-2%
  - Higher cigarette taxes/prices increase Demand for NRT and cessation services

Sources: 2003 Tobacco Use Supplement to the Current Population Survey; Tax Burden on Tobacco; compiled by Gary Giovino, RPCI
Lower SES populations are more price responsive

• Growing international evidence shows that cigarette smoking is most price responsive in lowest income countries

• Evidence from U.S. and U.K. shows that cigarette price increases have greatest impact on smoking among lowest income and least educated populations

• In U.S., for example, estimates indicate that smoking in households below median income level about four times more responsive to price than those above median income level

*Implies tax increases may be progressive*

Sources: Farrelly, et al., 2001; Chaloupka *et al.*, 2000
Proportion of disposable income youth spends on cigarettes likely to exceed that for adults

Peer influences much more important for young smokers than for adult smokers

Young smokers less addicted than adult smokers

Young people tend to discount the future more heavily than adults

Because kids are highly sensitive to price, and given that 90 percent of smokers start when they are 18 or younger, an increase in excise taxes is one of the best ways to achieve long run reductions in overall smoking
Cigarette Prices And Kids

- A 10% increase in price reduces smoking prevalence among youth by nearly 7%.

- A 10% increase in price reduces average cigarette consumption among young smokers by over 6%.

- Higher cigarette prices significantly reduce teens’ probability of becoming daily, addicted smokers; prevent moving to later stages of uptake.

- 10% price increase reduces probability of any initiation by about 3%, but reduces probability of daily smoking by nearly 9% and reduces probability of heavy daily smoking by over 10%.

Impact of a Federal Cigarette Tax Increase

Based on these estimates, a $0.61 per pack increase in the Federal cigarette tax (to $1.00 per pack) would:

- Reduce cigarette sales by over 1.1 billion packs
- Generate over $10 billion in new revenues
- Lead over 1.4 million current smokers to quit
  - Prevent almost 1.9 million youth from taking up smoking
    - Prevent over 900 premature deaths caused by smoking
  - Generate significant reductions in spending on health care to treat diseases caused by smoking
    - Reduce most state tobacco-related revenues
Tax Increases and Minnesota

Based on these estimates, a $0.50 per pack increase in the Minnesota cigarette tax would:

- Reduce cigarette sales by 13.8 million packs
- Generate over $128 million in new revenues
- Lead almost 18,000 adult smokers to quit
  - Prevent almost 23,000 youth from taking up smoking
  - Prevent over 11,200 premature deaths caused by smoking
- Generate significant reductions in spending on health care to treat smoking attributable diseases

A reduction in the tax (e.g., elimination of the 75 cent ‘fee’) would have the opposite impact.
Myths About Economic Impact of Tobacco Taxation and Tobacco Control

• Impact on Revenues?

  Myth: Government revenues will fall as cigarette taxes rise, since people buy fewer cigarettes.

  Truth: Cigarette tax revenues rise with cigarette tax rates, even as consumption declines.

  • Every significant increase in federal and state cigarette taxes has resulted in significant increase in revenues.

  Sources: Sunley, et al., 2000; World Bank, 1999
Positive Effect of Tax Increases on Revenues Results from:

Low share of tax in price:
- state taxes account for less than 20% of price
- total taxes account for just over 25% of price
- *Implies that large tax increase will have much smaller impact on price*

Less than proportionate decline in consumption:
- 10% price increase reduces consumption by 4%

**Example:**
- Price $4.00, State tax $1.00
  - Doubling of tax raises price to $5.00 – 25% increase
  - 25% price increase reduces sales by 10%
    - *90% of original sales at higher tax increases revenues by 80%*

Sustainability of Cigarette Tax Revenues

Some suggest that increases in revenues will not be sustained over time as consumption declines, tax evasion increases

- Looked at significant state tax increases over past 15 years where increase was maintained for at least 5 years
  - Separately for states with major tobacco control programs

**Conclusions:**
- All significant state tax increases resulted in significant increases in state tax revenues
  - Nominal increases in revenues sustained over time in states without tobacco control programs
  - Nominal revenues decline over time in states with tobacco control programs, but are significantly higher many years later than prior to tax increase
Cigarette Excise Tax Revenues, Alaska

Myths About Economic Impact of Tobacco Taxation and Tobacco Control

• Impact on Jobs?

  Myth: Higher tobacco taxes and tobacco control generally will result in substantial job losses

  Truth: Money not spent on tobacco will be spent on other goods and services, creating alternative employment

  • Many countries/states will see net gains in employment as tobacco consumption falls

Source: Jacobs, et al., 2000
Myths About Economic Impact of Tobacco Taxation and Tobacco Control

- Impact on Tax Evasion?

  Myth: Tax evasion negates the effects of increases in tobacco taxes

  Truth: Even in the presence of tax evasion, tax increases reduce consumption and raise revenues

- Extent of tax evasion often overstated
- Other factors important in explaining level of tax evasion
- Effective policies exist to deter tax evasion

Myths About Economic Impact of Tobacco Taxation and Tobacco Control

- Extent of Tax Evasion?

International Tobacco Control Policy Evaluation Study

- Longitudinal cohort study of smokers in many countries
  - Original country study focused on Canada and Australia
  - Added Ireland, Malaysia, Thailand, China, and Korea; others in preparation/planning

- Approximately, smokers surveyed in each country in each wave

- Detailed information collected on smoking behavior and variety of related issues
  - Cigarette purchase patterns/sources

Efforts to Curb Tax Evasion

- Any focused on internet, phone and mail order sales:
  - Utiright ban on direct sales (e.g. New York state policy)
  - Major shipping companies (e.g., Federal Xpress) agree not to ship cigarettes to consumers
    - Hasn’t established similar policy
  - Major credit card companies agree to ban use of credit cards for direct cigarette purchases
- States apply Jenkins Act to identify direct purchasers and to collect taxes due
  - Promising approach based on early data
- Reservation sales similar focus in some states
  - Minnesota imposes tax on reservation
Myths About Economic Impact of Tobacco Taxation and Tobacco Control

• Regressivity?

  Myth: Cigarette tax increases will negatively impact on the lowest income populations

Truth: Poor consumers are more responsive to price increases

• Should consider progressivity or regressivity of overall fiscal system

• Any negative impact can be offset by use of new tax revenues to support programs targeting lowest income population or protect funding for current programs
Many states earmark tobacco tax revenues for comprehensive tobacco control programs:
- CA – 1989 and 1999 ballot initiatives
- MA – 1993 ballot initiative
- Several others since

Others devote portion of MSA or other settlement revenues to comprehensive programs.

Comprehensive programs support a variety of activities:
- Anti-smoking advertising
- Quitlines and other cessation support
- School based prevention programs
- Community-based cessation and prevention efforts
- Much more

These activities can add to the impact of tax increases in promoting cessation and preventing initiation.

Research Findings – Comprehensive Programs and State Cigarette Sales

• Higher spending on tobacco control efforts significantly reduces cigarette consumption

• Marginal impact of tobacco control spending greater in states with higher levels of cigarette sales per capita; average impact significantly higher in states with larger programs

• Disaggregated program spending suggests that impact of programs focusing on policy change is greater than spending on other programs

Sources: Farrelly, Pechacek and Chaloupka. 2001; Liang et. al 2001
Research Findings – Comprehensive Programs and Youth Smoking

- Higher spending on tobacco control efforts significantly reduces youth smoking prevalence and cigarette consumption among young smokers - estimated effects about 3 times those for adults

- Estimated impact of spending at CDC recommended levels: minimum: 8-9% reduction in youth smoking prevalence; maximum: over 20% reduction

- Estimates suggest that greatest impact is on earlier stages of youth smoking uptake

Sources: Farrelly, et al. 2001; Chaloupka et. al 2001
Conclusions

Substantial increases in cigarette and other tobacco product prices, including those resulting from significant increases in tobacco excise taxes, lead to large reductions in tobacco use and, in the long run, reduce the public health toll caused by tobacco use.

Additional reductions in overall smoking and in the prevalence of youth smoking result when tax increases are coupled with comprehensive tobacco control efforts.
